

STANDARD OPERATING PROCEDURE

SUCCESS Bank Internal Ticketing

A role-by-role operational guide.

Every screen in this deck was captured from the running application.

Branch User

raises the ticket

Agent

works and resolves it

Supervisor

watches SLA and
escalations

Admin

configures the system

Auditor

reads everything, changes
nothing

How to use this deck

Read it in order the first time; use Section 14 as a desk reference after that

WHAT THIS IS

A step-by-step operational guide. Each role is taken from signing in to a finished ticket, using screens captured from the running application. Every workflow slide follows the same shape: what you do, what the system does back, and who picks it up next.

WHAT IT IS NOT

Not a feature tour, and not a specification. Where the system does not do something people often expect — approvals, in-app notifications, ticket merging — this deck says so rather than staying silent.

FIND YOUR ROLE

Branch User

You raise tickets and follow them

Section 6

Agent

You work and resolve them

Section 7

Supervisor

You watch SLA and escalations

Section 8

Admin

You configure the system

Section 9

Auditor

You review; you change nothing

Section 10

SECTION 02

What the system is for

One record for every operational problem, from the moment it is raised to the moment it is closed.

The problem it replaces

Why a shared record beats a shared inbox

Without it

A blocked card is reported by phone. A duplicated debit goes to somebody's inbox. Nobody can say how long either has been open, who owns it, or what was decided.

With it

Every problem gets a number, an owner, a deadline and a history. Months later an auditor can answer who changed what, and when.

HOW A TICKET ARRIVES

Portal

A branch user fills in the form and attaches evidence

Email

A message to the support mailbox becomes a ticket automatically

Email intake is implemented but off by default (IMAP_ENABLED=false) and needs a real mailbox. Everything else in this deck works out of the box.

SECTION 03

Roles and permissions

Five roles, one per user. This is the whole model — there are no per-user overrides.

Who can do what

Enforced server-side in core/authz.py — the interface only hides what the API would refuse anyway

Role	Tickets	Assignment	Users & org	Audit	Escalations
Branch User	Own only — raise, comment, attach	—	—	—	—
Agent	Any in scope — progress, resolve	Assign to a person	—	—	—
Supervisor	As agent	Also auto-assign, rules, leave	Read directory	—	Yes
Admin	As agent	As supervisor, plus the delay	Full control	Yes	Yes
Auditor	Read only — no writes at all	—	—	Yes	—

Super admin is a second tier on top of Admin, not a sixth role. Only a super admin can create another super admin or change one's password — otherwise any admin could take over the account.

The auditor is read-only everywhere. It can open any ticket, dashboard and report, and every attempt to write is refused with a 403 — including comments and attachments.

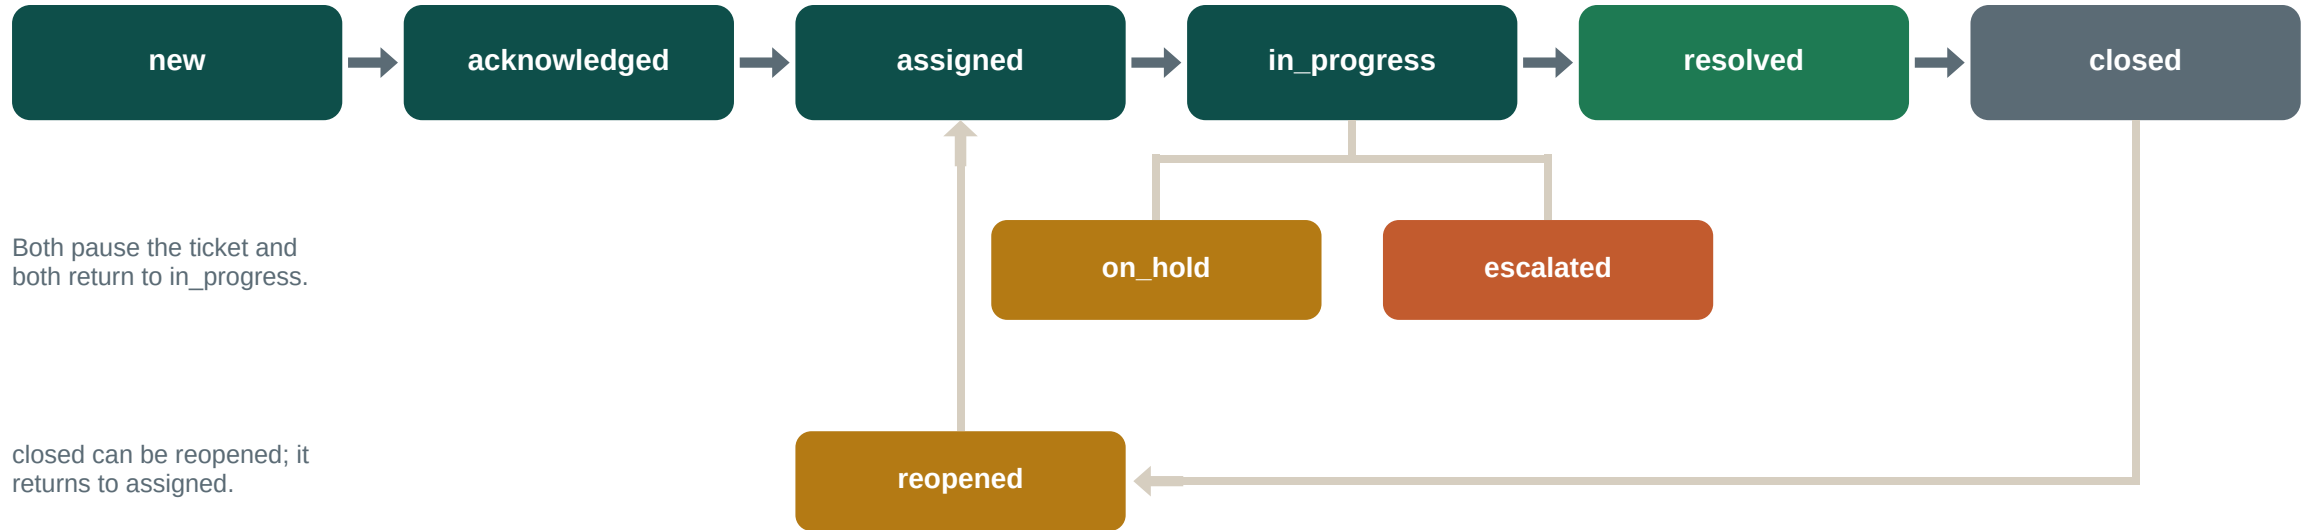

SECTION 04

The ticket lifecycle

Nine statuses. The API enforces which moves are legal — an illegal jump is refused, not merely discouraged.

Status flow

Reproduced from VALID_TRANSITIONS in ticket_service.py — these are the only legal moves

TWO RULES PEOPLE GET WRONG

closed is reachable from any open state

Closing early is a withdrawal — the problem went away, or it was raised in error.

resolved is NOT reachable from assigned

The ticket must have been worked first, so 'resolved' means something.

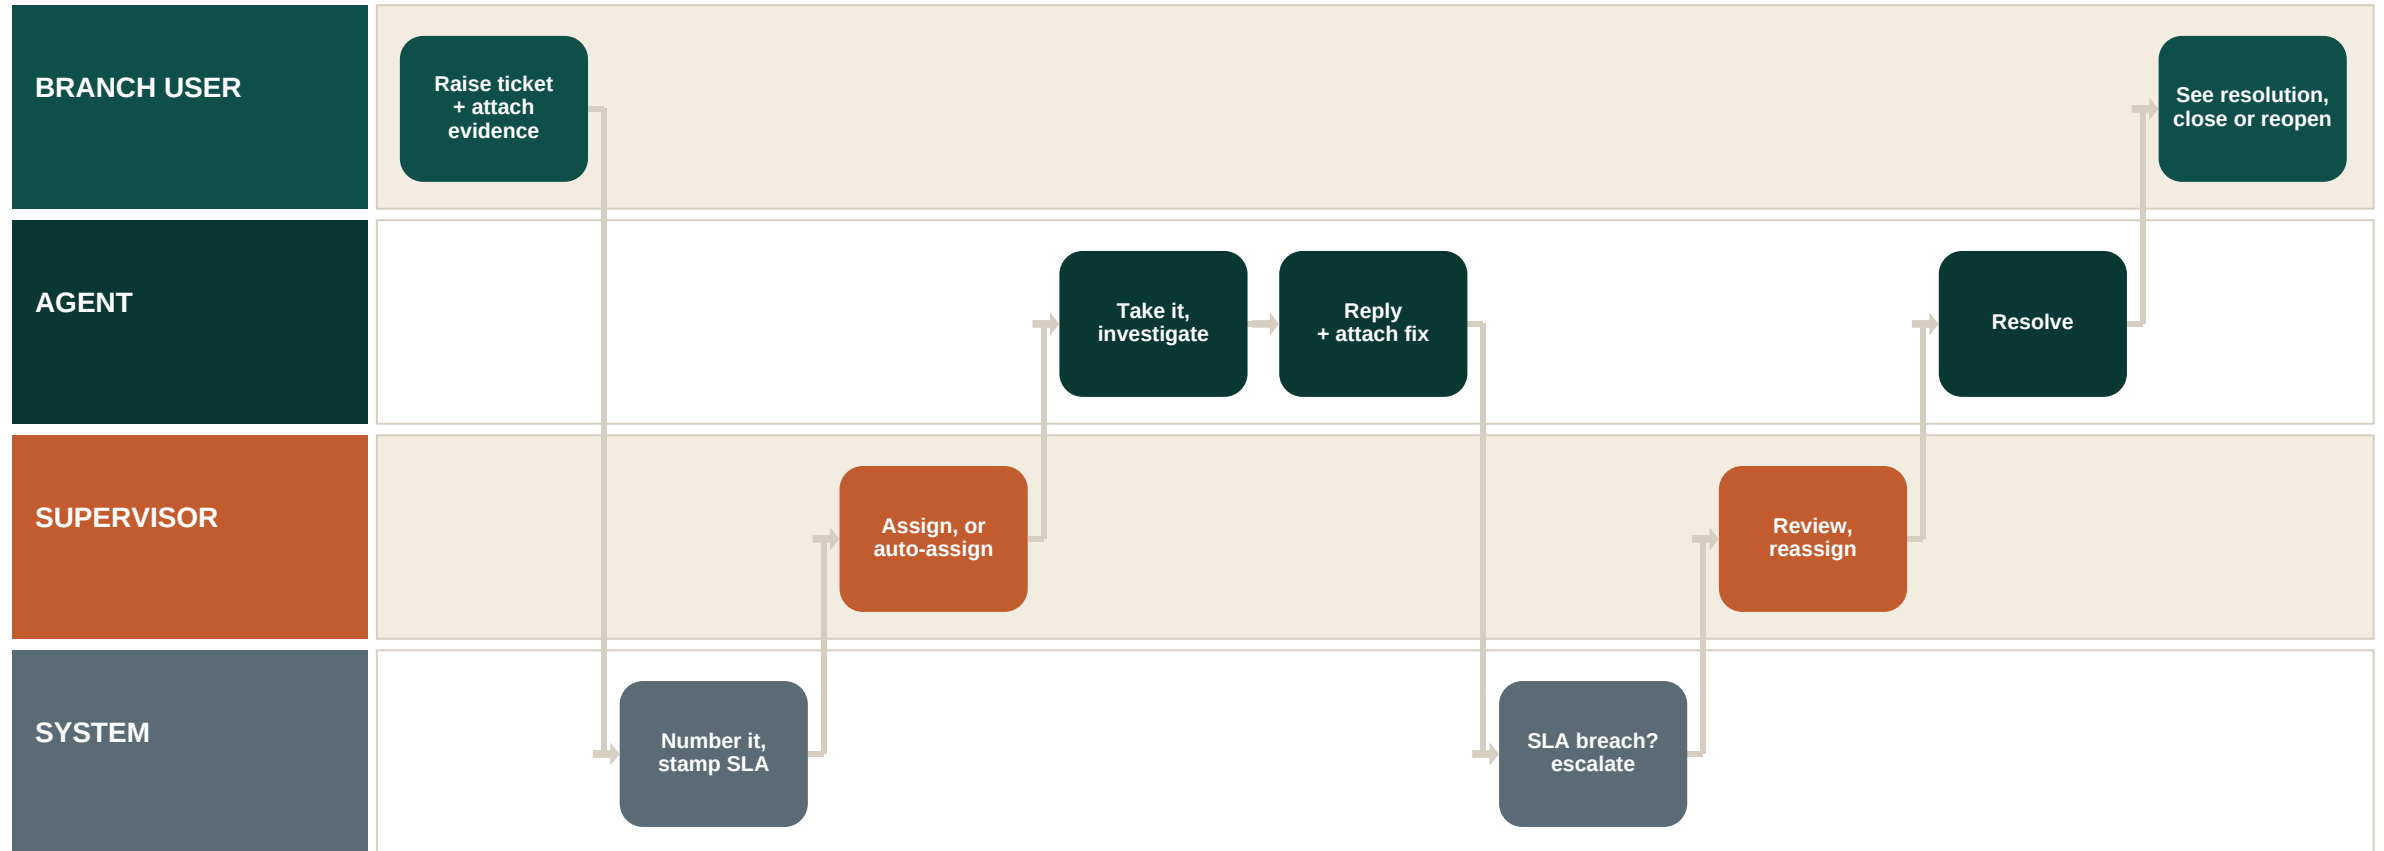

SECTION 05

End to end, across the roles

The seams matter more than the steps. This is where a ticket changes hands.

Who holds the ticket, and when

Left to right in time; each band is one role

The connectors are the handoffs. Two of them are a person deciding: the supervisor choosing an owner, and the branch user closing or reopening. The rest happen because the system moved the ticket, or because the next role was already watching. Note what the system does not do — it numbers the ticket and starts the clock, but it does not choose who works it.

SECTION 06

Branch user workflow

You raise the problem, supply the evidence, answer questions, and see the resolution.

S SUCCESS

Internal Ticketing for SUCCESS Bank.

Branches raise issues. Admins triage. Agents resolve.
Supervisors watch SLAs. Auditors review immutable
logs. One platform.

© SUCCESS Bank — internal use only.

The sign-in form is centered on a light beige background. It has a white border and a subtle drop shadow. The form contains the following elements:

- 1** **Sign in** header with the subtext "Use your corporate credentials."
- 2** **Work email** label above a text input field containing "you@successbank.com".
- 3** **Password** label above a password input field with masked characters "*****".
- A dark teal **Sign in** button.
- A note at the bottom: "Accounts with two-factor authentication will be asked for a code next."

ON THIS SCREEN

- 1** Your bank email address
- 2** Your password
- 3** Sign in

ACTION

Enter your bank email and password, then select Sign in.

RESULT

You land on your dashboard. If your account has a second factor enabled, you are asked for a 6-digit code first.

NEXT

Step 02 — read your dashboard.

Read your dashboard

ON THIS SCREEN

- 1 Replies appear here
- 2 Attach a file to your reply

ACTION

Answer any question the agent asks, attaching more evidence if needed.

RESULT

When the agent resolves it, their explanation and any file they attached appear here together.

NEXT

If it is fixed, the ticket is closed. If not, it can be reopened.

What a branch user cannot see

Three rules worth knowing before you ask where something went

Internal notes — and their attachments

Agents can mark a note internal. You will not see the note, and you will not see any file attached to it. It is not hidden in the page; the server refuses to send it.

Other people's tickets

You see only tickets you raised. Opening someone else's by its link returns nothing.

Team-wide numbers

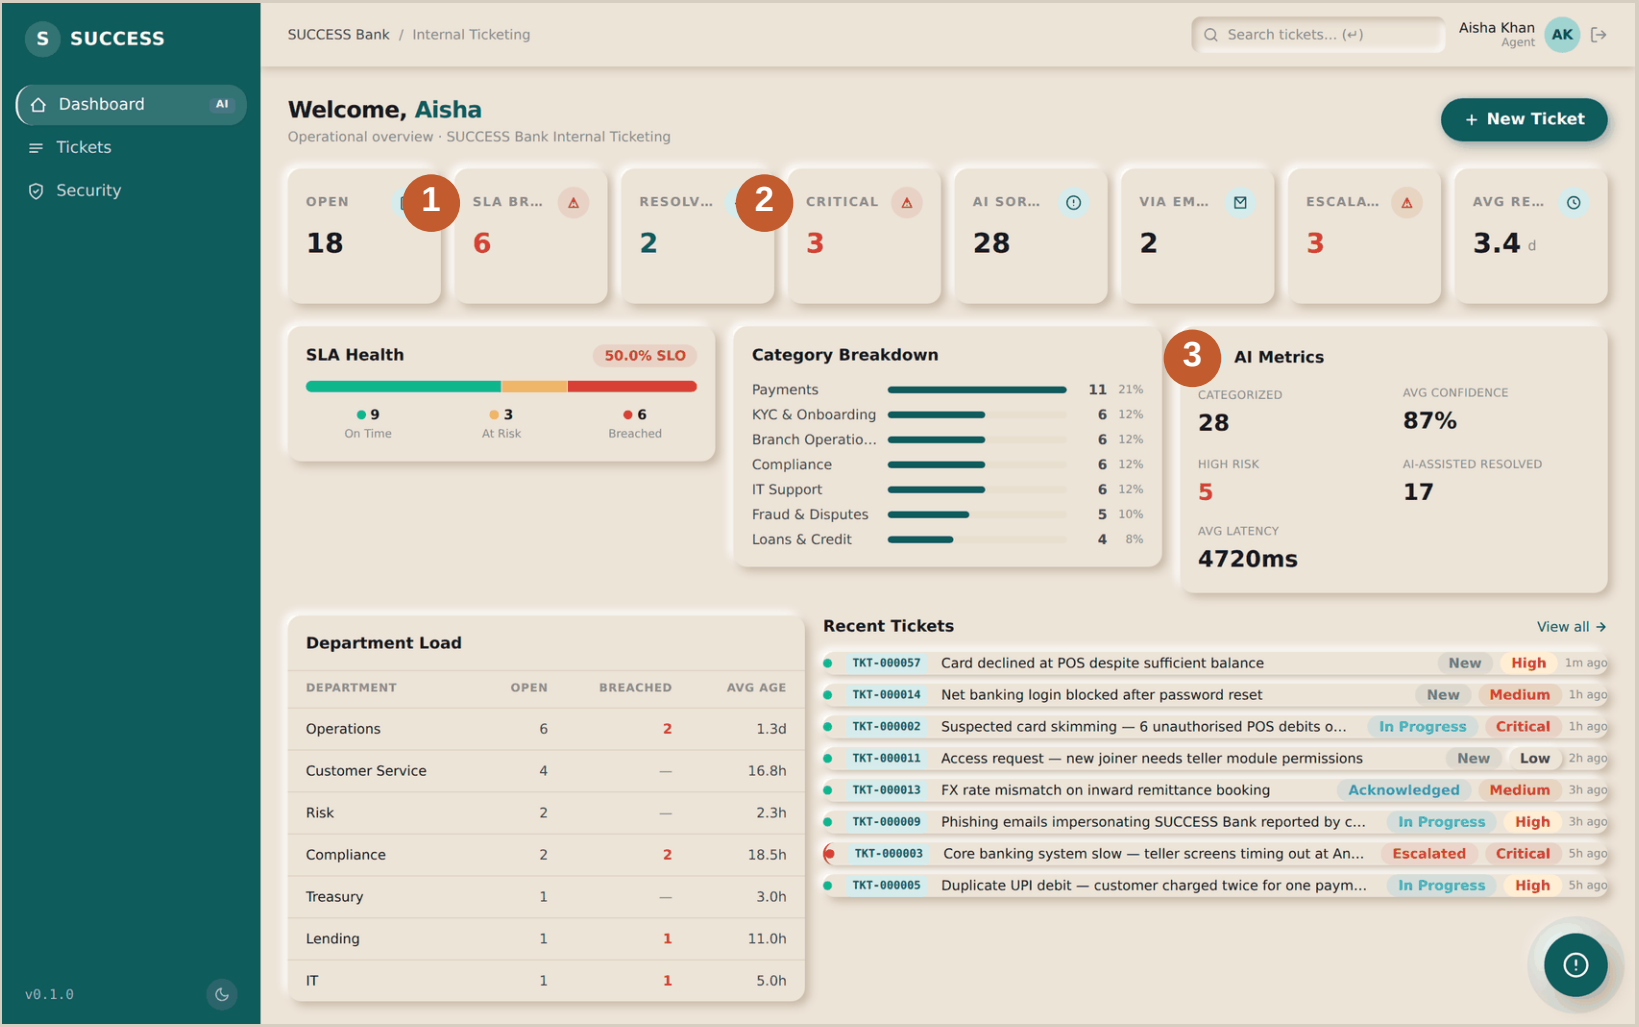

SLA health, category and department breakdowns and AI metrics are for agents and above. Your dashboard shows your own three counts instead.

If you believe a ticket of yours is missing, it is far more likely that it was raised by a colleague than that it was deleted — tickets are never deleted, and every change is recorded in the audit trail.

SECTION 07

Agent workflow

You pick the ticket up, investigate, keep the requester informed, and resolve it.

ON THIS SCREEN

- 1 SLA Breached — deal with these first
- 2 Critical open
- 3 AI panel

ACTION

Sign in and read the KPI strip before opening anything.

RESULT

Every tile is a live count and opens the exact list behind it.

NEXT

Step 09 — open the queue.

Work the queue

The screenshot displays the 'SUCCESS Bank / Internal Ticketing' dashboard. On the left, a sidebar contains 'SUCCESS', 'Dashboard', 'Tickets' (highlighted with a red circle '1'), and 'Security'. The main area shows a 'Tickets' section with '57 tickets'. A search bar is labeled 'Search by title, keyword, ticket number...' with a red circle '2' next to it. A 'Filters' button is also present. The ticket list includes:

- TKT-000057**: New, High. Card declined at POS despite sufficient balance. SLA OK - 5h 58m left. 2m ago.
- TKT-000014**: New, Medium. Net banking login blocked after password reset. AI: access (84%), Low Risk (15%). SLA OK - 22h 57m left. Customer Service. 1h ago.
- TKT-000002**: In Progress, Critical. Suspected card skimming — 6 unauthorised POS debits overnight. AI: fraud (97%), High Risk (93%). At Risk - 27m left. Risk. 1h ago.
- TKT-000011**: New, Low. Access request — new joiner needs teller module permissions. AI: access (79%), Low Risk (10%). SLA OK - 69h 57m left. Customer Service. 2h ago.
- TKT-000009**: In Progress, High. Phishing emails impersonating SUCCESS Bank reported by customers. AI: fraud (95%), High Risk (79%). SLA OK - 2h 57m left. Risk. 3h ago.
- TKT-000013**: Acknowledged, Medium. FX rate mismatch on inward remittance booking. AI: treasury (81%), Med Risk (31%). SLA OK - 20h 57m left. Treasury. 3h ago.
- TKT-000003**: Escalated, Critical. Core banking system slow — teller screens timing out at Andheri branch. AI: it (91%), High Risk (76%). Breached - 3h 3m overdue. IT. 5h ago.
- TKT-000005**: In Progress, High. Duplicate UPI debit — customer charged twice for one payment. AI: payments (92%), Med Risk (34%). At Risk - 27m left. Operations. 5h ago.
- TKT-000012**: New, Low. Cheque book request not delivered after 15 days. AI: operations (72%), Low Risk (8%). SLA OK - 65h 57m left. Operations. 6h ago.
- TKT-000006**: Assigned, High. KYC re-verification pending — account restricted for 3 days. AI: kyc (86%), Med Risk (42%). Breached - 1h 3m overdue. Compliance. 7h ago.

ON THIS SCREEN

- 1 Every ticket in your scope
- 2 Filter by status, priority or owner

ACTION

Filter to unassigned or to your own, and choose what to work on.

RESULT

Agents see every ticket in their org scope, not just their own.

NEXT

Step 10 — start with what is breaching.

Deal with breaches first

The screenshot shows the SUCCESS Bank Internal Ticketing dashboard. The left sidebar contains navigation links: SUCCESS, Dashboard, Tickets (selected), and Security. The main header shows 'SUCCESS Bank / Internal Ticketing', a search bar, and the user 'Aisha Khan Agent'. The 'Tickets' section shows '18 tickets' and a '+ New Ticket' button. A search bar is present with a red circle '1' next to it. Below the search bar, the 'ACTIVE' filter is set to 'Open tickets'. The ticket list is displayed in a grid, showing 10 tickets. The first ticket, TKT-000057, is highlighted with a red border and a red circle '1' next to it. It is a 'New' ticket with 'High' priority, titled 'Card declined at POS despite sufficient balance', and has an 'SLA OK' status with '5h 58m left'. The second ticket, TKT-000014, is also highlighted with a red border and a red circle '1' next to it. It is a 'New' ticket with 'Medium' priority, titled 'Net banking login blocked after password reset', and has an 'SLA OK' status with '22h 57m left'. The third ticket, TKT-000002, is highlighted with a red border and a red circle '1' next to it. It is an 'In Progress' ticket with 'Critical' priority, titled 'Suspected card skimming — 6 unauthorised POS debits overnight', and has an 'At Risk' status with '27m left'. The fourth ticket, TKT-000011, is highlighted with a red border and a red circle '1' next to it. It is a 'New' ticket with 'Low' priority, titled 'Access request — new joiner needs teller module permissions', and has an 'SLA OK' status with '69h 57m left'. The fifth ticket, TKT-000009, is highlighted with a red border and a red circle '1' next to it. It is an 'In Progress' ticket with 'High' priority, titled 'Phishing emails impersonating SUCCESS Bank reported by customers', and has an 'SLA OK' status with '2h 57m left'. The sixth ticket, TKT-000003, is highlighted with a red border and a red circle '1' next to it. It is an 'Escalated' ticket with 'Critical' priority, titled 'Core banking system slow — teller screens timing out at Andheri branch', and has an 'At Risk' status with '3h 3m overdue'. The seventh ticket, TKT-000005, is highlighted with a red border and a red circle '1' next to it. It is an 'In Progress' ticket with 'High' priority, titled 'Duplicate UPI debit — customer charged twice for one payment', and has an 'At Risk' status with '27m left'. The eighth ticket, TKT-000012, is highlighted with a red border and a red circle '1' next to it. It is a 'New' ticket with 'Low' priority, titled 'Cheque book request not delivered after 15 days', and has an 'At Risk' status with '27m left'. The ninth ticket, TKT-000006, is highlighted with a red border and a red circle '1' next to it. It is an 'Assigned' ticket with 'High' priority, titled 'KYC re-verification pending — account restricted for 3 days', and has an 'At Risk' status with '27m left'. The tenth ticket, TKT-000008, is highlighted with a red border and a red circle '1' next to it. It is a 'New' ticket with 'Medium' priority, titled 'Access request — new joiner needs teller module permissions', and has an 'SLA OK' status with '69h 57m left'.

ACTION

Write what you found and attach the corrected statement or screenshot.

RESULT

Files attached here belong to this reply, so the requester sees your fix beside the answer that explains it.

NEXT

Step 13 — resolve, or escalate.

Resolve, or escalate — and what each means

Both are one action on the ticket page

Resolve

Use when the problem is fixed. Only available once the ticket has been worked — you cannot jump straight from Assigned to Resolved, which is what makes 'resolved' mean something.

Escalate

Use when it needs someone else. The ticket moves to Escalated, is reassigned to the least-loaded holder of the target role, and an escalation event is recorded. Escalating twice for the same reason does nothing — the second is suppressed.

Put on hold

Use when you are waiting on someone outside the team. The ticket stays open and keeps counting toward your queue.

Closing is always available, from any open state — it means the problem went away or the ticket was raised in error, not that it was solved.

SECTION 08

Supervisor workflow

You watch the deadlines and the escalations, and step in before a breach becomes a complaint.

Vikram Rao on leave until 2026-08-29	4 open

3

DEPARTMENT

ON THIS SCREEN

- 1 Hand the choice to the router
- 2 Each candidate's open queue — what the router ranks on
- 3 Anyone on leave is marked, and sorted to the bottom

ACTION

Choose a name, or select Auto-assign to take the lightest queue.

RESULT

Each name shows the number of open tickets that person is already carrying — the same number the router ranks on, so you can see what you are overriding. Anyone on leave is labelled with their return date and sorted to the bottom. You can still assign to them knowingly; auto-assign will not.

NEXT

The agent picks it up from their queue.

Auto-assign is supervisor and above; an agent may assign a specific ticket.

What the router actually does

Three steps, and it stops at the first that yields somebody

Auto-assign is not a black box. It runs the same search every time, and each step falls through to the next rather than failing.

1 — A category rule

If a rule names an owner for this category, they get it. Optional: most categories have none.

2 — Someone in the ticket's branch

Of the people left, whoever in that branch is carrying the fewest open tickets.

3 — Anyone assignable

Failing both, the lightest open queue anywhere.

TWO RULES THAT HOLD AT EVERY STEP

Agents before supervisors

Ranking on workload alone sends everything to whoever is idlest, which is reliably a supervisor — they carry no queue of their own — and frontline work would skip the agents entirely.

Nobody on leave, ever

A category rule naming someone who is away is skipped rather than obeyed. Parking tickets on an absent person is worse than having no rule.

The ticket nobody picked up

Why moving assignment to a person does not risk the SLA

SLA deadlines are stamped when the ticket is raised, and the clock runs from that moment. If assignment waited for a person and nobody was on shift, a ticket raised overnight could breach — and then escalate — without ever having had an owner.

The safety net

A background worker assigns anything still unassigned after a set delay, using the same router.

You set the delay

An admin sets it while the system is running — two hours by default, anywhere from fifteen minutes to a week.

It never overrides you

It only touches tickets with no owner. It never reassigns one somebody has already given out.

So the window is yours to triage in, not a gap. Shorten it if tickets sit too long; lengthen it if the system is assigning work your supervisors wanted to place themselves.

How escalation actually fires

Nobody has to be watching for this to happen

Every 5 minutes a background worker looks for tickets past their resolution deadline. For each one it finds, it marks the breach and evaluates the escalation rules.

1 — Rule matched

The most specific rule wins. A category-specific rule beats a catch-all, and `priority_threshold` is read as a minimum, so a 'high' rule also covers critical.

2 — Ticket moved

Status becomes Escalated and it is reassigned to the least-loaded holder of the target role.

3 — Evidence written

An `escalation_events` row records the trigger, the rule and the target.

4 — People told

The target and the manager list are emailed after the change commits — a failed email never rolls back the escalation.

A ticket will not escalate twice for the same trigger — otherwise the worker would raise a new event every five minutes until somebody resolved it.

SECTION 09

Admin workflow

You decide who exists, what they may do, and how the organisation is shaped.

Leave — Aisha Khan

While away, auto-assignment skips them. They can still sign in, and a supervisor can still assign to them deliberately.

From To

Note (optional)

Leave the end date empty for indefinite leave. Both dates are inclusive.

ON THIS SCREEN

- 1 First and last day, both inclusive
- 2 Leave the end date empty for indefinite leave
- 3 Clears the window and makes them available again

ACTION

Enter the first and last day away, then save.

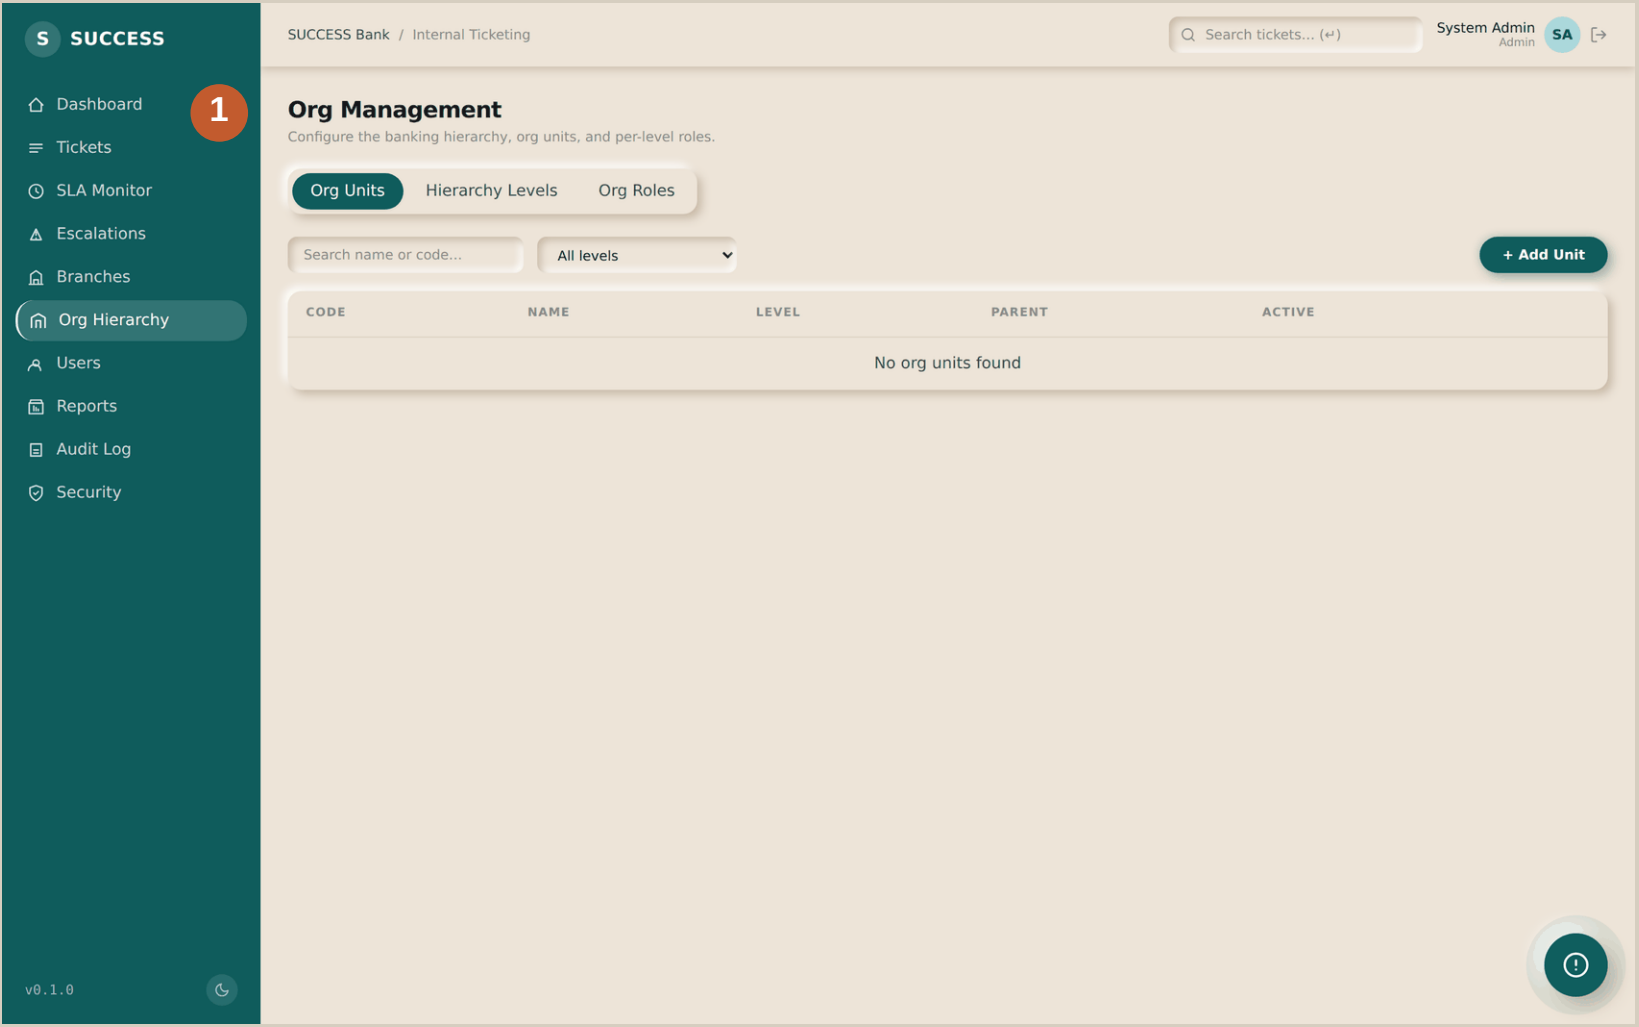

RESULT

Auto-assign skips them for that window and starts including them again the day after it ends — nobody has to remember to switch them back on. A supervisor can still assign to them deliberately, which is why they stay in the list rather than disappearing from it.

NEXT

Step 21 — shape the organisation.

Supervisors can set leave too — rota changes should not wait for an admin.

ON THIS SCREEN

1 Hierarchy levels and org units

ACTION

Define hierarchy levels, then units within them.

RESULT

The org tree drives ticket visibility: a user sees their unit's subtree, plus anything assigned to them personally.

NEXT

Step 22 — maintain the branch network.

Security

Security

Manage the protection on your own account.

Two-factor authentication

Adds a six-digit code from an authenticator app to your sign-in, so a stolen password alone is not enough to reach the account.

Off

Set up two-factor

Account

Signed in as admin@successbank.local

Role admin

v0.1.0

ON THIS SCREEN

1 Enrol a second factor

ACTION

Open Security, scan the QR code, and enter one code to confirm.

RESULT

MFA is only switched on once a correct code proves the app is working — so a failed scan cannot lock you out. Ten single-use recovery codes are shown once, and never again.

NEXT

Save the recovery codes somewhere safe before leaving this screen.

Save the recovery codes

This is the one screen you cannot go back to

Ten recovery codes are shown once, when you switch MFA on. Only their hashes are stored, so nobody — including an administrator — can show them to you again. Each works once, in place of a code from your app.

Lost your phone, still have codes

Use any unused recovery code at sign-in. It works once, then it is spent.

Lost both

An administrator clears your enrolment, and you set it up again from scratch.

Lost the only super admin

There is no route through the interface, by design. The flag has to be set on the database row.

SECTION 10

Auditor workflow

You can open everything and change nothing. Every write is refused by the server.

ON THIS SCREEN

1 No scope limit — every ticket

ACTION

Open any ticket and read its comments, attachments and timeline.

RESULT

Internal notes are visible to an auditor. Write controls are not offered, and would be refused if called directly.

NEXT

This is the end of the auditor's workflow — there is nothing to submit.

A caveat worth recording

Honest limitation of the audit trail as it stands today

The audit trail is append-only by convention, not by enforcement.

The application only ever inserts rows. But there is no database trigger and no revoked permission, so anything holding the database credentials could alter history. Closing this is the first item on the outstanding work list.

It is recorded here rather than left out, because an auditor is exactly the person who needs to know how much weight the trail can carry.

SECTION 11

Attachments

Where files can be added, who can see them, and the one rule people assume wrong.

Three places a file can be attached

The flow is the same in each: choose the files, then they upload once the thing they belong to exists

With the ticket, when it is raised

Evidence travels with the report rather than arriving afterwards.

WHO

Branch user, agent

With a reply

The file belongs to that reply, so a fix sits beside the answer explaining it.

WHO

Anyone who can comment

From the attachments panel

The file index for the whole ticket; files from replies are marked as such.

WHO

Anyone who can write

Limits: 15 MB per file. Images, PDF, Word, Excel, text and CSV are accepted. Executables and archives are refused outright — there is no malware scanner, and an unscanned archive is the usual way something nasty arrives.

The rule people get wrong

An internal note's attachment is as invisible as the note

What agents assume

"The note is internal, so the requester will not read my text — but the file I attached is just a file on the ticket."

What actually happens

The file is hidden too. It is filtered from the list and refused on download — and the refusal is a 404, so the response does not even confirm the note exists.

This matters because the file is usually the sensitive part. Hiding the note while serving its attachment would leak exactly what the flag exists to withhold.

Related: you cannot attach a file to somebody else's comment. Without that rule an agent could hang a file off the requester's own message, where it would read as something they had sent.

SECTION 12

The AI assistant

It answers questions about the work in front of you. It cannot change anything.

What it can and cannot do

Three properties are enforced by the server, not by the prompt

It cannot see more than you can

Context is fetched through the same visibility rules as the rest of the application. Point it at a ticket your role cannot open and it is told the ticket is unavailable — no title, no number, nothing.

It says when it does not know

Rather than producing generic advice. An assistant that invents ticket facts in a bank is worse than one that declines.

It cannot act

It has no write access. It will not change a status, assign a ticket or post a comment. Everything it produces is for you to act on.

If it reports that it cannot connect, the cause is almost always the local model rather than the application. The message it shows includes the specific fix.

SECTION 13

Common scenarios

Four situations, start to finish, naming who does what at each hop.

Scenario A — a duplicated debit

The everyday case: raised with evidence, worked, resolved

Branch user	Raises the ticket with a screenshot, the statement and a CSV of the transactions
System	Numbers it and stamps both SLA deadlines. It does not pick an owner
Supervisor	Assigns it — by hand, or with Auto-assign to take the lightest queue
Agent	Moves it to In Progress, checks the evidence, confirms the duplicate
Agent	Replies with the corrected statement attached to that reply, then resolves
Branch user	Sees the explanation and the corrected file together, and the ticket closes

Scenario B — nobody picked it up

What happens when a deadline passes and no one is watching

System	The SLA worker finds the ticket past its resolution deadline
System	Marks the breach, matches the most specific escalation rule
System	Moves it to Escalated, reassigns to the least-loaded holder of the target role
System	Writes an escalation event, then emails the target and the managers
Supervisor	Sees it in the escalation queue and confirms someone is on it

Scenario C — the agent needs more information

The two-way exchange that used to happen over email

Agent	Replies asking for the account number and a clearer screenshot
Branch user	Answers on the ticket and attaches the new screenshot
Agent	Continues, adding an internal note with findings the requester should not see
Branch user	Sees neither the internal note nor the file attached to it
Agent	Resolves with a public explanation

Scenario D — it was not actually fixed

Reopening, and what it does to the counts

Branch user	Reads the resolution and finds the problem still occurring
Branch user	Reopens the ticket, explaining what is still wrong
System	The ticket returns to the open set and counts against the dashboard again
Agent	Picks it back up from Assigned and works it a second time
Agent	Resolves again — the whole history stays on the one ticket

SECTION 14

Quick reference

The desk copy. Statuses, who does what, and where things live.

Status reference

Who can move a ticket into each state, and what it means

Status	Means	Set by
new	Raised, not yet looked at	System, on creation
acknowledged	Seen, not yet owned	Agent
assigned	Has an owner	Supervisor, or agent; system after the delay
in_progress	Actively being worked	Agent
on_hold	Waiting on someone outside the team	Agent
escalated	Handed up — by hand or by SLA breach	Agent, or the SLA worker
resolved	Fixed; only from in_progress or escalated	Agent
closed	Finished, or withdrawn; reachable from any open state	Agent, or the requester
reopened	Was not actually fixed; returns to the open set	Requester or agent

Where to click

The shortest path to the thing you need

I want to...	Go to	Who can
Raise a problem	Tickets → New Ticket	Everyone
Follow my ticket	Tickets → open it	Everyone (own only, for branch users)
Find what is breaching	Dashboard → SLA Breached tile	Agent and above
Give a ticket an owner	Ticket → Assignee → Assign	Agent and above
Let the router choose	Ticket → Assignee → Auto-assign	Supervisor, admin
Say someone is away	Users → Leave	Supervisor, admin
See what escalated	Escalations	Supervisor, admin
Check deadlines	SLA Monitor	Supervisor, admin
Add or change a user	Users	Admin
Change the org tree	Org Management	Admin
Export figures	Reports → CSV / PDF / Excel	Supervisor, admin, auditor
Review who changed what	Audit	Admin, auditor
Turn on my second factor	Security	Everyone

What this system does not do

Stated plainly, so nobody waits for a feature that is not coming today

No approval workflow

Nothing routes for sign-off before proceeding.

No in-app notifications

Notifications are email only. There is no bell icon.

No ticket merging

Duplicates can be marked as such, but two tickets cannot be combined into one.

No customer portal

Every account is an employee account; branch staff raise tickets on customers' behalf.

No per-user permissions

One role per user. Anything finer is expressed through the org tree.

If one of these would help, it belongs on the ticket list — not in a workaround.

Questions, or something here that does not match what you see?

This deck describes the application at commit 9fe8bc4. If a screen has changed, the deck is wrong and not the application — raise it so this can be recaptured.

Operational procedures — deploying, restoring, what to do at 3am — are in docs/runbook.md.
